软件安装及编译环境搭建

点击下载 [Virtualbox VM](#) 和 [Ubuntu 20.04 LTS](#)

1、于VirtualBoxVM安装Ubuntu

建立新的VM，并加以命名

规划8GB内存供VM使用。

预留200GB硬盘空间，供后续存放SDK用。

2、Ubuntu开机设定

第一次开机需要挂载安装光盘ISO档案

开始安装

(如需在虚拟机上使用共享剪贴板和共享文件夹等提升使用体验, 请自行搜索方法, 此处不再赘述)

3、MobaXterm安装及开发板连接

官网地址：

<https://mobaxterm.mobatek.net/>

将开发板上通过串口转TTL板与电脑连接

注意板端的RX脚接 [usb-ttl] 的TX脚，板端TX脚接 [usb-ttl] 的RX脚

使用mobaxterm配置串口终端

终端显示

```
[root@cvitek]~#
```

4、套件安装以及SDK编译

在编译SDK之前，Ubuntu需要安装以下套件：

```
sudo apt-get update
sudo apt-get install -y build-essential
sudo apt-get install -y ninja-build
sudo apt-get install -y automake
sudo apt-get install -y autoconf
sudo apt-get install -y libtool
sudo apt-get install -y wget
sudo apt-get install -y curl
sudo apt-get install -y git
sudo apt-get install -y gcc
sudo apt-get install -y libssl-dev
sudo apt-get install -y bc
sudo apt-get install -y slib
sudo apt-get install -y squashfs-tools
sudo apt-get install -y android-sdk-libsparse-utils
sudo apt-get install -y android-sdk-ext4-utils
sudo apt-get install -y jq
sudo apt-get install -y cmake
sudo apt-get install -y python3-distutils
sudo apt-get install -y tclsh
sudo apt-get install -y scons
sudo apt-get install -y parallel
sudo apt-get install -y ssh-client
sudo apt-get install -y tree
sudo apt-get install -y python3-dev
sudo apt-get install -y python3-pip
sudo apt-get install -y device-tree-compiler
sudo apt-get install -y libssl-dev
sudo apt-get install -y ssh
sudo apt-get install -y cpio
sudo apt-get install -y squashfs-tools
sudo apt-get install -y fakeroot
sudo apt-get install -y libncurses5
sudo apt-get install -y flex
sudo apt-get install -y bison
```

检查cmake版本

```
cmake --version
```

如果小于版本号3.16则需要更新cmake，以3.16.5为例

```
# 注意先删除低版本cmake
sudo apt autoremove cmake

wget https://cmake.org/files/v3.16/cmake-3.16.5.tar.gz
tar zxvf cmake-3.16.5.tar.gz
cd cmake-3.16.5/
./configure
make
sudo make install
```

获取SDK源码

```
git clone https://github.com/sophgo/sophpi-huashan.git
```

编译

```
1.cd cvi_media_sdk/
2.source build/cvisetup.sh          # 配置编译环境
3.defconfig cv1812h_wevb_0007a_emmc
4.build_all                          # 编译SDK
```

编译成功

```
[TARGET] rootfs
python3 /home/chile/sophpi-huashan/cvi_media_sdk/build/tools/common/image_tool/raw2cimg.py /home/chile/sophpi-huashan/c_cv1812h_wevb_0007a_emmc /home/chile/sophpi-huashan/cvi_media_sdk/build/boards/mars/cv1812h_wevb_0007a_emmc/partition
